Question description Your task is to maintain an array of n values and efficiently process the following types of queries: 1. Increase the first value in range $[a,b]$ by 1, the second value by 2, the third value by 3, and so on. 2. Calculate the sum of values in range $[a,b]$. Input The first input line has two integers n and q: the size of the array and the number of queries. The next line has n values $t_1, t_2, \dots, t_n$: the initial contents of the array. Finally, there are q lines describing the queries. The format of each line is either "1 a b" or "2 a b". Output Print the answer to each sum query. Constraints • $1 \leq n, q \leq 2 \cdot 10^5$ • $1 \leq t_i \leq 10^6$ • $1 \leq a \leq b \leq n$
